

### LIST OVERVIEW

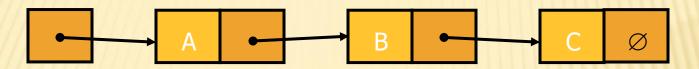

- Linked lists
  - Abstract data type (ADT)
- Basic operations of linked lists
  - + Insert, find, delete, print, etc.
- × Variations of linked lists
  - + Circular linked lists
  - + Doubly linked lists
- \* Use of both Method:
  - + (LIFO -FIFO)

## Types of Linked List

#### There are mainly three types of linked list

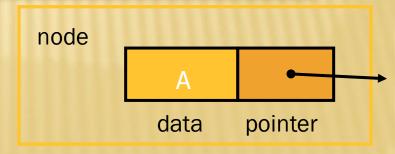

- Singly linked list
- Each node has only one link part that contains the address of next node.
- Circular linked list
- In this linked list the linked field of the last node contain the address of the first node of list
- Doubly linked list
- In this linked list all nodes are linked together by multiple number of links which help in accessing both the successor and predecessor node from the given node position

#### LINKED LISTS

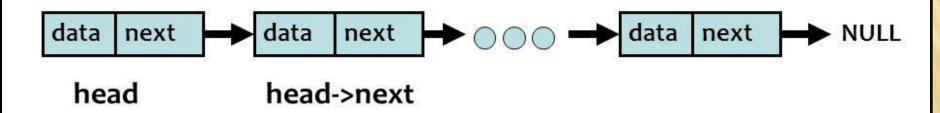

Head

- \* A linked list is a series of connected nodes.
- **×** Each node contains at least
  - + A piece of data (any type)
  - + Pointer to the next node in the list
- Head: pointer to the first node
- The last node points to NULL

#### **Linear Linked Lists: Definition**

```
struct node
{ int data; struct node *next; };
```

// type name for new type is "struct node"

struct node \* head; // declares the pointer for first node (head)

### A SIMPLE LINKED LIST CLASS

#### \* Operations of List

- + *IsEmpty*: determine whether or not the list is empty.
- + <u>InsertNode</u>: insert a new node at a particular position.
- + FindNode: find a node with a given value.
- + **DeleteNode**: delete a node with a given value.
- + **DisplayList**: print all the nodes in the list

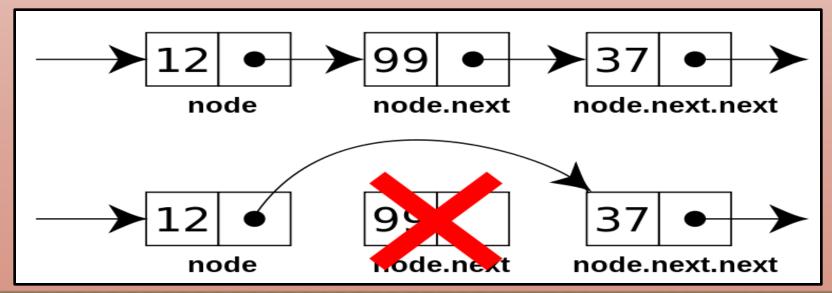

## INSERTING A NEW NODE

- Possible cases of <u>InsertNode</u>
  - 1. Insert into an empty list
  - 2. Insert in front
  - 3. Insert at back

- But, in fact, only need to handle two cases
  - + Insert as the first node (Case 1)
  - + Insert in the end of the list (Case 2)

#### **DELETE NODE**

- Possible cases of <u>DeleteNode</u>
  - Delete into an empty list
  - Delete in front
  - Delete at back
- But, in fact, only need to handle two cases
  - Delete as the first node (Case 4)
  - Delete in the end of the list (Case 5)

# Operation of Linked List

Some basic operation of linked list are as follows:-

- > Insertion of a node
- Inserting a node before first node
- Inserting a node after last node
- Inserting a node at particular position
- Deletion of a node
- deleting a node before first node
- deleting a node after last node
- deleting a node from particular position
